TITLE : DISK PLAYER

ABSTRACT : PURPOSE: To improve operability by starting reproduction from a designated reproduction starting address, and terminating reproduction at designated reproduction terminating address, and at the same time, making fade-in action at the reproduction starting address and making fade-out action at the reproduction terminating address.

CONSTITUTION: When inputted from an operating means 8, reproduction starting address is stored in an operating means 5 and reproduction terminating address is stored in the operating means 8 respectively. When a reproduction start indication signal (d) is given, the address information read from a pickup means 1 is inputted to the operating means 5, 8 and the position of reproduction is watched at all times. When the reproduction starting address is detected, the operating means 5 shifts from searching operation to reproducing operation, and outputs a signal (b) of a signal processing circuit 3. At this time, a signal (c) outputted by the operating means 8 is changed from high level to low level, and applied to the base of a transistor 43 through a time constant circuit. Accordingly, the transistor 43 is made off slowly, and so-called fade-in action is performed.
